# Chapter 1

## Summary of libarcdata

libarcdata is a library for data access. It provides a uniform interface to several types of grid storage and catalogs using various protocols. See the DataPoint inheritance diagram for a list of currently supported protocols. The interface can be used to read, write, list, transfer and delete data to and from storage systems and catalogs.

The library uses ARC's dynamic plugin mechanism to load plugins for specific protocols only when required at runtime. These plugins are called Data Manager Components (DMCs). The DataHandle class should be used to automatically load the required DMC at runtime. To create a new DMC for a protocol which is not yet supported see the instruction and examples in the DataPoint class documentation. This documentation also gives a complete overview of the interface.

The following protocols are currently supported in standard distributions of ARC (except XRootd, which is not yet distributed).

ARC (arc://) - Protocol to access the Chelonia storage system developed by ARC.

File (file://) - Regular local file system.

GridFTP (gsiftp://) - GridFTP is essentially the FTP protocol with GSI security. Regular FTP can also be used.

HTTP(S/G) (http://) - Hypertext Transfer Protocol. HTTP over SSL (HTTPS) and HTTP over GSI (HTTPG) are also supported.

LDAP (ldap://) - Lightweight Directory Access Protocol. LDAP is used in grids mainly to store information about grid services or resources rather than to store data itself.

LFC (lfc://) - The LCG File Catalog (LFC) is a replica catalog developed by CERN. It consists of a hierarchical namespace of grid files and each filename can be associated with one or more physical locations.

RLS (rls://) - The Replica Location Service (RLS) is a replica catalog developed by Globus. It maps filenames in a flat namespace to one or more physical locations, and can also store meta-information on each file.

SRM (srm://) - The Storage Resource Manager (SRM) protocol allows access to data distributed across physical storage through a unified namespace and management interface.

XRootd (root://) - Protocol for data access across large scale storage clusters. More information can be found at <http://xrootd.slac.stanford.edu/>

## Chapter 2

# ARC Data Library libarcdata Hierarchical Index

### 2.1 ARC Data Library libarcdata Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Arc::CacheParameters . . . . .	8
Arc::Checksum . . . . .	9
Arc::Adler32Sum . . . . .	7
Arc::ChecksumAny . . . . .	10
Arc::CRC32Sum . . . . .	11
Arc::MD5Sum . . . . .	78
Arc::DataBuffer . . . . .	12
Arc::DataCallback . . . . .	19
Arc::DataHandle . . . . .	20
Arc::DataMover . . . . .	22
Arc::DataPoint . . . . .	26
Arc::DataPointDirect . . . . .	43
Arc::DataPointIndex . . . . .	50
Arc::DataPointLoader . . . . .	60
Arc::DataPointPluginArgument . . . . .	61
Arc::DataSpeed . . . . .	62
Arc::DataStatus . . . . .	66
Arc::FileCache . . . . .	70
Arc::FileCacheHash . . . . .	76
Arc::FileInfo . . . . .	77

## Chapter 3

# ARC Data Library libarcdata Data Structure Index

### 3.1 ARC Data Library libarcdata Data Structures

Here are the data structures with brief descriptions:

<a href="#">Arc::Adler32Sum</a> (Implementation of Adler32 checksum ) . . . . .	7
<a href="#">Arc::CacheParameters</a> (Contains data on the parameters of a cache ) . . . . .	8
<a href="#">Arc::CheckSum</a> (Defines interface for various checksum manipulations ) . . . . .	9
<a href="#">Arc::CheckSumAny</a> (Wrapper for <a href="#">CheckSum</a> class ) . . . . .	10
<a href="#">Arc::CRC32Sum</a> (Implementation of CRC32 checksum ) . . . . .	11
<a href="#">Arc::DataBuffer</a> (Represents set of buffers ) . . . . .	12
<a href="#">Arc::DataCallback</a> (This class is used by <a href="#">DataHandle</a> to report missing space on local filesystem )	19
<a href="#">Arc::DataHandle</a> (This class is a wrapper around the <a href="#">DataPoint</a> class ) . . . . .	20
<a href="#">Arc::DataMover</a> ( <a href="#">DataMover</a> provides an interface to transfer data between two DataPoints ) . .	22
<a href="#">Arc::DataPoint</a> (A <a href="#">DataPoint</a> represents a data resource and is an abstraction of a URL ) . . . . .	26
<a href="#">Arc::DataPointDirect</a> (This is a kind of generalized file handle ) . . . . .	43
<a href="#">Arc::DataPointIndex</a> (Complements <a href="#">DataPoint</a> with attributes common for Indexing Service URLs ) . . . . .	50
<a href="#">Arc::DataPointLoader</a> (Class used by <a href="#">DataHandle</a> to load the required DMC ) . . . . .	60
<a href="#">Arc::DataPointPluginArgument</a> (Class representing the arguments passed to DMC plugins ) . .	61
<a href="#">Arc::DataSpeed</a> (Keeps track of average and instantaneous transfer speed ) . . . . .	62
<a href="#">Arc::DataStatus</a> (Status code returned by many <a href="#">DataPoint</a> methods ) . . . . .	66
<a href="#">Arc::FileCache</a> ( <a href="#">FileCache</a> provides an interface to all cache operations ) . . . . .	70
<a href="#">Arc::FileCacheHash</a> ( <a href="#">FileCacheHash</a> provides methods to make hashes from strings ) . . . . .	76
<a href="#">Arc::FileInfo</a> ( <a href="#">FileInfo</a> stores information about files (metadata) ) . . . . .	77
<a href="#">Arc::MD5Sum</a> (Implementation of MD5 checksum ) . . . . .	78

## Chapter 4

# ARC Data Library libarcdata Data Structure Documentation

### 4.1 Arc::Adler32Sum Class Reference

Implementation of Adler32 checksum.

```
#include <Checksum.h>
```

Inheritance diagram for Arc::Adler32Sum::

#### 4.1.1 Detailed Description

Implementation of Adler32 checksum.

The documentation for this class was generated from the following file:

- CheckSum.h

## 4.2 Arc::CacheParameters Struct Reference

Contains data on the parameters of a cache.

```
#include <FileCache.h>
```

### 4.2.1 Detailed Description

Contains data on the parameters of a cache.

The documentation for this struct was generated from the following file:

- FileCache.h

## 4.3 Arc::Checksum Class Reference

Defines interface for various checksum manipulations.

```
#include <Checksum.h>
```

Inheritance diagram for Arc::Checksum::

### 4.3.1 Detailed Description

Defines interface for various checksum manipulations.

This class is used during data transfers through [DataBuffer](#) class

The documentation for this class was generated from the following file:

- CheckSum.h

## 4.4 Arc::ChecksumAny Class Reference

Wrapper for [Checksum](#) class.

```
#include <Checksum.h>
```

Inheritance diagram for Arc::ChecksumAny::

### 4.4.1 Detailed Description

Wrapper for [Checksum](#) class.

To be used for manipulation of any supported checksum type in a transparent way.

The documentation for this class was generated from the following file:

- CheckSum.h

## 4.5 Arc::CRC32Sum Class Reference

Implementation of CRC32 checksum.

```
#include <Checksum.h>
```

Inheritance diagram for Arc::CRC32Sum::

### 4.5.1 Detailed Description

Implementation of CRC32 checksum.

The documentation for this class was generated from the following file:

- CheckSum.h

## 4.6 Arc::DataBuffer Class Reference

Represents set of buffers.

```
#include <DataBuffer.h>
```

### Public Member Functions

- [operator bool](#) () const
- [DataBuffer](#) (unsigned int size=65536, int blocks=3)
- [DataBuffer](#) ([Checksum](#) \*cksum, unsigned int size=65536, int blocks=3)

- bool [wait\\_any](#) ()
- bool [wait\\_used](#) ()
- bool [wait\\_for\\_read](#) ()
- bool [wait\\_for\\_write](#) ()
- bool [checksum\\_valid](#) () const
- const [Checksum](#) \* [checksum\\_object](#) () const
- bool [wait\\_eof\\_read](#) ()
- bool [wait\\_read](#) ()
- bool [wait\\_eof\\_write](#) ()
- bool [wait\\_write](#) ()
- bool [wait\\_eof](#) ()
- unsigned long long int [eof\\_position](#) () const
- unsigned int [buffer\\_size](#) () const

## Data Fields

- [DataSpeed](#) *speed*

## Data Structures

- struct `buf_desc`
- class `checksum_desc`

### 4.6.1 Detailed Description

Represents set of buffers.

This class is used during data transfer using [DataPoint](#) classes.

### 4.6.2 Constructor & Destructor Documentation

#### 4.6.2.1 Arc::DataBuffer::DataBuffer (unsigned int *size* = 65536, int *blocks* = 3)

Constructor

##### Parameters:

- size* size of every buffer in bytes.  
*blocks* number of buffers.

#### 4.6.2.2 Arc::DataBuffer::DataBuffer ([Checksum](#) \* *cksum*, unsigned int *size* = 65536, int *blocks* = 3)

Constructor

##### Parameters:

- size* size of every buffer in bytes.  
*blocks* number of buffers.  
*cksum* object which will compute checksum. Should not be destroyed till [DataBuffer](#) itself.

#### 4.6.2.3 Arc::DataBuffer::~~DataBuffer ()

Destructor.

### 4.6.3 Member Function Documentation

#### 4.6.3.1 int Arc::DataBuffer::add ([Checksum](#) \* *cksum*)

Add a checksum object which will compute checksum of buffer.

##### Parameters:

- cksum* object which will compute checksum. Should not be destroyed till [DataBuffer](#) itself.

**Returns:**

integer position in the list of checksum objects.

**4.6.3.2 unsigned int Arc::DataBuffer::buffer\_size () const**

Returns size of buffer in object. If not initialized then this number represents size of default buffer.

**4.6.3.3 const CheckSum\* Arc::DataBuffer::checksum\_object () const**

Returns CheckSum object specified in constructor, returns NULL if index is not in list.

**Parameters:**

*index* of the checksum in question.

**4.6.3.4 bool Arc::DataBuffer::checksum\_valid () const**

Returns true if checksum was successfully computed, returns false if index is not in list.

**Parameters:**

*index* of the checksum in question.

**4.6.3.5 unsigned long long int Arc::DataBuffer::eof\_position () const [inline]**

Returns offset following last piece of data transferred.

**4.6.3.6 bool Arc::DataBuffer::eof\_read ()**

Returns true if object was informed about end of transfer on 'read' side.

**4.6.3.7 void Arc::DataBuffer::eof\_read (bool v)**

Informs object if there will be no more request for 'read' buffers. v true if no more requests.

**4.6.3.8 bool Arc::DataBuffer::eof\_write ()**

Returns true if object was informed about end of transfer on 'write' side.

**4.6.3.9 void Arc::DataBuffer::eof\_write (bool v)**

Informs object if there will be no more request for 'write' buffers. v true if no more requests.

**4.6.3.10 bool Arc::DataBuffer::error ()**

Returns true if object was informed about error or internal error occurred.

**4.6.3.11 bool Arc::DataBuffer::error\_read ()**

Returns true if object was informed about error on 'read' side.

**4.6.3.12 void Arc::DataBuffer::error\_read (bool *v*)**

Informs object if error accured on 'read' side.

**Parameters:**

*v* true if error.

**4.6.3.13 bool Arc::DataBuffer::error\_transfer ()**

Returns true if eror occured inside object.

**4.6.3.14 bool Arc::DataBuffer::error\_write ()**

Returns true if object was informed about error on 'write' side.

**4.6.3.15 void Arc::DataBuffer::error\_write (bool *v*)**

Informs object if error accured on 'write' side.

**Parameters:**

*v* true if error.

**4.6.3.16 bool Arc::DataBuffer::for\_read ()**

Check if there are buffers which can be taken by [for\\_read\(\)](#). This function checks only for buffers and does not take eof and error conditions into account.

**4.6.3.17 bool Arc::DataBuffer::for\_read (int & *handle*, unsigned int & *length*, bool *wait*)**

Request buffer for READING INTO it.

**Parameters:**

*handle* returns buffer's number.

*length* returns size of buffer

*wait* if true and there are no free buffers, method will wait for one.

**Returns:**

true on success

**4.6.3.18 bool Arc::DataBuffer::for\_write ()**

Check if there are buffers which can be taken by [for\\_write\(\)](#). This function checks only for buffers and does not take eof and error conditions into account.

**4.6.3.19 bool Arc::DataBuffer::for\_write (int & *handle*, unsigned int & *length*, unsigned long long int & *offset*, bool *wait*)**

Request buffer for WRITING FROM it.

**Parameters:**

- handle* returns buffer's number.
- length* returns size of buffer
- wait* if true and there are no free buffers, method will wait for one.

**4.6.3.20 bool Arc::DataBuffer::is\_notwritten (char \* *buf*)**

Informs object that data was NOT written from buffer (and releases buffer).

**Parameters:**

- buf* - address of buffer

**4.6.3.21 bool Arc::DataBuffer::is\_notwritten (int *handle*)**

Informs object that data was NOT written from buffer (and releases buffer).

**Parameters:**

- handle* buffer's number.

**4.6.3.22 bool Arc::DataBuffer::is\_read (char \* *buf*, unsigned int *length*, unsigned long long int *offset*)**

Informs object that data was read into buffer.

**Parameters:**

- buf* - address of buffer
- length* amount of data.
- offset* offset in stream, file, etc.

**4.6.3.23 bool Arc::DataBuffer::is\_read (int *handle*, unsigned int *length*, unsigned long long int *offset*)**

Informs object that data was read into buffer.

**Parameters:**

*handle* buffer's number.  
*length* amount of data.  
*offset* offset in stream, file, etc.

**4.6.3.24 bool Arc::DataBuffer::is\_written (char \* *buf*)**

Informs object that data was written from buffer.

**Parameters:**

*buf* - address of buffer

**4.6.3.25 bool Arc::DataBuffer::is\_written (int *handle*)**

Informs object that data was written from buffer.

**Parameters:**

*handle* buffer's number.

**4.6.3.26 Arc::DataBuffer::operator bool (void) const [inline]**

Check if [DataBuffer](#) object is initialized.

**4.6.3.27 ]**

char\* Arc::DataBuffer::operator[ ] (int *n*)

Direct access to buffer by number.

**4.6.3.28 bool Arc::DataBuffer::set ([Checksum](#) \* *cksum* = NULL, unsigned int *size* = 65536, int *blocks* = 3)**

Reinitialize buffers with different parameters.

**Parameters:**

*size* size of every buffer in bytes.  
*blocks* number of buffers.  
*cksum* object which will compute checksum. Should not be destroyed till [DataBuffer](#) itself.

**4.6.3.29 bool Arc::DataBuffer::wait\_any ()**

Wait (max 60 sec.) till any action happens in object. Returns true if action is eof on any side.

**4.6.3.30 bool Arc::DataBuffer::wait\_eof ()**

Wait till end of transfer happens on any side.

**4.6.3.31 bool Arc::DataBuffer::wait\_eof\_read ()**

Wait till end of transfer happens on 'read' side.

**4.6.3.32 bool Arc::DataBuffer::wait\_eof\_write ()**

Wait till end of transfer happens on 'write' side.

**4.6.3.33 bool Arc::DataBuffer::wait\_for\_read ()**

Wait till no more buffers taken for "READING INTO" left in object.

**4.6.3.34 bool Arc::DataBuffer::wait\_for\_write ()**

Wait till no more buffers taken for "WRITING FROM" left in object.

**4.6.3.35 bool Arc::DataBuffer::wait\_read ()**

Wait till end of transfer or error happens on 'read' side.

**4.6.3.36 bool Arc::DataBuffer::wait\_used ()**

Wait till there are no more used buffers left in object.

**4.6.3.37 bool Arc::DataBuffer::wait\_write ()**

Wait till end of transfer or error happens on 'write' side.

**4.6.4 Field Documentation****4.6.4.1 [DataSpeed Arc::DataBuffer::speed](#)**

This object controls transfer speed.

The documentation for this class was generated from the following file:

- DataBuffer.h

## 4.7 Arc::DataCallback Class Reference

This class is used by [DataHandle](#) to report missing space on local filesystem.

```
#include <DataCallback.h>
```

### 4.7.1 Detailed Description

This class is used by [DataHandle](#) to report missing space on local filesystem.

One of 'cb' functions here will be called if operation initiated by DataHandle::StartReading runs out of disk space.

The documentation for this class was generated from the following file:

- DataCallback.h

## 4.8 Arc::DataHandle Class Reference

This class is a wrapper around the [DataPoint](#) class.

```
#include <DataHandle.h>
```

### Public Member Functions

- [DataHandle](#) (const URL &url, const UserConfig &usercfg)
- [~DataHandle](#) ()
- [DataPoint](#) \* [operator](#) → ()
- const [DataPoint](#) \* [operator](#) → () const
- [DataPoint](#) & [operator](#) \* ()
- const [DataPoint](#) & [operator](#) \* () const
- bool [operator](#)! () const
- [operator](#) bool () const

### 4.8.1 Detailed Description

This class is a wrapper around the [DataPoint](#) class.

It simplifies the construction, use and destruction of [DataPoint](#) objects and should be used instead of [DataPoint](#) classes directly. The appropriate [DataPoint](#) subclass is created automatically and stored internally in [DataHandle](#). A [DataHandle](#) instance can be thought of as a pointer to the [DataPoint](#) instance and the [DataPoint](#) can be accessed through the usual dereference operators. A [DataHandle](#) cannot be copied.

### 4.8.2 Constructor & Destructor Documentation

#### 4.8.2.1 Arc::DataHandle::DataHandle (const URL & url, const UserConfig & usercfg) [inline]

Construct a new [DataHandle](#).

#### 4.8.2.2 Arc::DataHandle::~DataHandle () [inline]

Destructor.

### 4.8.3 Member Function Documentation

#### 4.8.3.1 const [DataPoint](#)& Arc::DataHandle::operator \* () const [inline]

Returns a const reference to a [DataPoint](#) object.

#### 4.8.3.2 [DataPoint](#)& Arc::DataHandle::operator \* () [inline]

Returns a reference to a [DataPoint](#) object.

**4.8.3.3** `Arc::DataHandle::operator bool (void) const` `[inline]`

Returns true if the [DataHandle](#) is valid.

**4.8.3.4** `bool Arc::DataHandle::operator! (void) const` `[inline]`

Returns true if the [DataHandle](#) is not valid.

**4.8.3.5** `const DataPoint* Arc::DataHandle::operator → () const` `[inline]`

Returns a const pointer to a [DataPoint](#) object.

**4.8.3.6** `DataPoint* Arc::DataHandle::operator → ()` `[inline]`

Returns a pointer to a [DataPoint](#) object.

The documentation for this class was generated from the following file:

- [DataHandle.h](#)

## 4.9 Arc::DataMover Class Reference

[DataMover](#) provides an interface to transfer data between two DataPoints.

```
#include <DataMover.h>
```

### Public Member Functions

- [DataMover](#) ()
- [~DataMover](#) ()
- [DataStatus Transfer](#) ([DataPoint](#) &source, [DataPoint](#) &destination, [FileCache](#) &cache, const [URLMap](#) &map, callback cb=NULL, void \*arg=NULL, const char \*prefix=NULL)
- [DataStatus Transfer](#) ([DataPoint](#) &source, [DataPoint](#) &destination, [FileCache](#) &cache, const [URLMap](#) &map, unsigned long long int min\_speed, time\_t min\_speed\_time, unsigned long long int min\_average\_speed, time\_t max\_inactivity\_time, callback cb=NULL, void \*arg=NULL, const char \*prefix=NULL)
- [DataStatus Delete](#) ([DataPoint](#) &url, bool errcont=false)
- bool [verbose](#) ()
- void [verbose](#) (bool)
- void [verbose](#) (const std::string &prefix)
- bool [retry](#) ()
- void [retry](#) (bool)

- void [checks](#) (bool v)
- void [set\\_default\\_min\\_speed](#) (unsigned long long int min\_speed, time\_t min\_speed\_time)
- void [set\\_default\\_min\\_average\\_speed](#) (unsigned long long int min\_average\_speed)
- void [set\\_default\\_max\\_inactivity\\_time](#) (time\_t max\_inactivity\_time)
- void [set\\_progress\\_indicator](#) ([DataSpeed::show\\_progress\\_t](#) func=NULL)
- void [set\\_preferred\\_pattern](#) (const std::string &pattern)

### 4.9.1 Detailed Description

[DataMover](#) provides an interface to transfer data between two DataPoints.

Its main action is represented by Transfer methods

### 4.9.2 Constructor & Destructor Documentation

#### 4.9.2.1 Arc::DataMover::DataMover ()

Constructor.

#### 4.9.2.2 Arc::DataMover::~~DataMover ()

Destructor.

### 4.9.3 Member Function Documentation

#### 4.9.3.1 void Arc::DataMover::checks (bool *v*)

Set if to make check for existence of remote file (and probably other checks too) before initiating 'reading' and 'writing' operations.

**Parameters:**

*v* true if allowed (default is true).

#### 4.9.3.2 bool Arc::DataMover::checks ()

Check if check for existence of remote file is done before initiating 'reading' and 'writing' operations.

#### 4.9.3.3 [DataStatus](#) Arc::DataMover::Delete ([DataPoint](#) & *url*, bool *errcont* = false)

Delete the file at url.

#### 4.9.3.4 void Arc::DataMover::force\_to\_meta (bool)

Set if file should be transferred and registered even if such LFN is already registered and source is not one of registered locations.

#### 4.9.3.5 void Arc::DataMover::passive (bool)

Set if passive transfer should be used for FTP-like transfers.

#### 4.9.3.6 void Arc::DataMover::retry (bool)

Set if transfer will be retried in case of failure.

#### 4.9.3.7 bool Arc::DataMover::retry ()

Check if transfer will be retried in case of failure.

#### 4.9.3.8 void Arc::DataMover::secure (bool)

Set if high level of security (encryption) will be used during transfer if available.

#### 4.9.3.9 void Arc::DataMover::set\_default\_max\_inactivity\_time (time\_t *max\_inactivity\_time*) [inline]

Set maximal allowed time for waiting for any data. For more information see description of [DataSpeed](#) class.

#### 4.9.3.10 void Arc::DataMover::set\_default\_min\_average\_speed (unsigned long long int *min\_average\_speed*) [inline]

Set minimal allowed average transfer speed (default is 0 averaged over whole time of transfer. For more information see description of [DataSpeed](#) class.

#### 4.9.3.11 void Arc::DataMover::set\_default\_min\_speed (unsigned long long int *min\_speed*, time\_t *min\_speed\_time*) [inline]

Set minimal allowed transfer speed (default is 0) to 'min\_speed'. If speed drops below for time longer than 'min\_speed\_time' error is raised. For more information see description of [DataSpeed](#) class.

#### 4.9.3.12 void Arc::DataMover::set\_preferred\_pattern (const std::string & *pattern*) [inline]

Set a preferred pattern for ordering of replicas.

#### 4.9.3.13 void Arc::DataMover::set\_progress\_indicator (DataSpeed::show\_progress\_t *func* = NULL) [inline]

Set function which is called every second during the transfer.

#### 4.9.3.14 [DataStatus](#) Arc::DataMover::Transfer ([DataPoint](#) & *source*, [DataPoint](#) & *destination*, [FileCache](#) & *cache*, const URLMap & *map*, unsigned long long int *min\_speed*, time\_t *min\_speed\_time*, unsigned long long int *min\_average\_speed*, time\_t *max\_inactivity\_time*, callback *cb* = NULL, void \* *arg* = NULL, const char \* *prefix* = NULL)

Initiates transfer from 'source' to 'destination'.

##### Parameters:

*min\_speed* minimal allowed current speed.

*min\_speed\_time* time for which speed should be less than 'min\_speed' before transfer fails.

*min\_average\_speed* minimal allowed average speed.

*max\_inactivity\_time* time for which should be no activity before transfer fails.

#### 4.9.3.15 [DataStatus](#) Arc::DataMover::Transfer ([DataPoint](#) & *source*, [DataPoint](#) & *destination*, [FileCache](#) & *cache*, const URLMap & *map*, callback *cb* = NULL, void \* *arg* = NULL, const char \* *prefix* = NULL)

Initiates transfer from 'source' to 'destination'.

##### Parameters:

*source* source URL.

*destination* destination URL.

*cache* controls caching of downloaded files (if destination url is "file:///"). If caching is not needed default constructor FileCache() can be used.

*map* URL mapping/conversion table (for 'source' URL).

*cb* if not NULL, transfer is done in separate thread and 'cb' is called after transfer completes/fails.

*arg* passed to 'cb'.

*prefix* if 'verbose' is activated this information will be printed before each line representing current transfer status.

#### 4.9.3.16 void Arc::DataMover::verbose (const std::string & *prefix*)

Activate printing information about transfer status.

##### Parameters:

*prefix* use this string if 'prefix' in [DataMover::Transfer](#) is NULL.

#### 4.9.3.17 void Arc::DataMover::verbose (bool)

Activate printing information about transfer status.

#### 4.9.3.18 bool Arc::DataMover::verbose ()

Check if printing information about transfer status is activated.

### 4.10.1 Detailed Description

A [DataPoint](#) represents a data resource and is an abstraction of a URL.

[DataPoint](#) uses ARC's Plugin mechanism to dynamically load the required Data Manager Component (DMC) when necessary. A DMC typically defines a subclass of [DataPoint](#) (e.g. [DataPointHTTP](#)) and is responsible for a specific protocol (e.g. http). DataPoints should not be used directly, instead the [DataHandle](#) wrapper class should be used, which automatically loads the correct DMC.

[DataPoint](#) defines methods for access to the data resource. To transfer data between two DataPoints, [DataMover::Transfer\(\)](#) can be used.

There are two subclasses of [DataPoint](#), [DataPointDirect](#) and [DataPointIndex](#). None of these three classes can be instantiated directly. [DataPointDirect](#) and its subclasses handle "physical" resources through protocols such as file, http and gsiftp. These classes implement methods such as [StartReading\(\)](#) and [StartWriting\(\)](#). [DataPointIndex](#) and its subclasses handle resources such as indexes and catalogs and implement methods like [Resolve\(\)](#) and [PreRegister\(\)](#).

When creating a new DMC, a subclass of either [DataPointDirect](#) or [DataPointIndex](#) should be created, and the appropriate methods implemented. [DataPoint](#) itself has no direct external dependencies, but plugins may rely on third-party components. The new DMC must also add itself to the list of available plugins and provide an [Instance\(\)](#) method which returns a new instance of itself, if the supplied arguments are valid for the protocol. Here is an example implementation of a new DMC for protocol MyProtocol which represents a physical resource accessible through protocol my://

```
#include <arc/data/DataPointDirect.h>

namespace Arc {

class DataPointMyProtocol : public DataPointDirect {
public:
    DataPointMyProtocol(const URL& url, const UserConfig& usercfg);
    static Plugin* Instance(PluginArgument *arg);
    virtual DataStatus StartReading(DataBuffer& buffer);
    ...
};

DataPointMyProtocol::DataPointMyProtocol(const URL& url, const UserConfig& usercfg) {
    ...
}

DataPointMyProtocol::StartReading(DataBuffer& buffer) { ... }

...

Plugin* DataPointMyProtocol::Instance(PluginArgument *arg) {
    DataPointPluginArgument *dmcarg = dynamic_cast<DataPointPluginArgument*>(arg);
    if (!dmcarg)
        return NULL;
    if (((const URL &)(*dmcarg)).Protocol() != "my")
        return NULL;
    return new DataPointMyProtocol(*dmcarg, *dmcarg);
}

} // namespace Arc

Arc::PluginDescriptor PLUGINS_TABLE_NAME[] = {
    { "my", "HED:DMC", 0, &Arc::DataPointMyProtocol::Instance },
    { NULL, NULL, 0, NULL }
};
```

## 4.10.2 Member Enumeration Documentation

### 4.10.2.1 enum [Arc::DataPoint::DataPointAccessLatency](#)

Describes the latency to access this URL.

For now this value is one of a small set specified by the enumeration. In the future with more sophisticated protocols or information it could be replaced by a more fine-grained list of possibilities such as an int value.

#### Enumerator:

***ACCESS\_LATENCY\_ZERO*** URL can be accessed instantly.

***ACCESS\_LATENCY\_SMALL*** URL has low (but non-zero) access latency, for example staged from disk.

***ACCESS\_LATENCY\_LARGE*** URL has a large access latency, for example staged from tape.

### 4.10.2.2 enum [Arc::DataPoint::DataPointInfoType](#)

Describes type of information about URL to request.

#### Enumerator:

***INFO\_TYPE\_MINIMAL*** Whatever protocol can get with no additional effort.

**INFO\_TYPE\_NAME** Only name of object (relative).

**INFO\_TYPE\_TYPE** Type of object - currently file or dir.

**INFO\_TYPE\_TIMES** Timestamps associated with object.

**INFO\_TYPE\_CONTENT** Metadata describing content, like size, checksum, etc.

**INFO\_TYPE\_ACCESS** Access control - ownership, permission, etc.

**INFO\_TYPE\_STRUCT** Fine structure - replicas, transfer locations, redirections.

**INFO\_TYPE\_REST** All the other parameters.

**INFO\_TYPE\_ALL** All the parameters.

### 4.10.3 Constructor & Destructor Documentation

#### 4.10.3.1 `virtual Arc::DataPoint::~~DataPoint ()` [virtual]

Destructor.

#### 4.10.3.2 `Arc::DataPoint::DataPoint (const URL & url, const UserConfig & usercfg)` [protected]

Constructor.

Constructor is protected because DataPoints should not be created directly. Subclasses should however call this in their constructors to set various common attributes.

##### Parameters:

*url* The URL representing the [DataPoint](#)

*usercfg* User configuration object

### 4.10.4 Member Function Documentation

#### 4.10.4.1 `virtual bool Arc::DataPoint::AcceptsMeta () const` [pure virtual]

If endpoint can have any use from meta information.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

#### 4.10.4.2 `virtual int Arc::DataPoint::AddChecksumObject (Checksum * cksum)` [pure virtual]

Add a checksum object which will compute checksum during transmission.

##### Parameters:

*cksum* object which will compute checksum. Should not be destroyed till DataPointer itself.

##### Returns:

integer position in the list of checksum objects.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.3** virtual [DataStatus](#) Arc::DataPoint::AddLocation (const URL & *url*, const std::string & *meta*) [pure virtual]

Add URL to list.

**Parameters:**

*url* Location URL to add.

*meta* Location meta information.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.4** virtual int Arc::DataPoint::BufNum () const [pure virtual]

Get suggested number of buffers for transfers.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.5** virtual long long int Arc::DataPoint::BufSize () const [pure virtual]

Get suggested buffer size for transfers.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.6** virtual bool Arc::DataPoint::Cache () const [virtual]

Returns true if file is cacheable.

**4.10.4.7** virtual [DataStatus](#) Arc::DataPoint::Check () [pure virtual]

Query the [DataPoint](#) to check if object is accessible.

If possible this method will also try to provide meta information about the object. It returns positive response if object's content can be retrieved.

Implemented in [Arc::DataPointIndex](#).

**4.10.4.8** virtual bool Arc::DataPoint::CheckChecksum () const [virtual]

Check if meta-information 'checksum' is available.

**4.10.4.9** virtual bool Arc::DataPoint::CheckCreated () const [virtual]

Check if meta-information 'creation/modification time' is available.

**4.10.4.10** virtual bool Arc::DataPoint::CheckSize () const [virtual]

Check if meta-information 'size' is available.

**4.10.4.11** `virtual bool Arc::DataPoint::CheckValid () const` [virtual]

Check if meta-information 'validity time' is available.

**4.10.4.12** `virtual DataStatus Arc::DataPoint::ClearLocations ()` [pure virtual]

Remove all locations.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.13** `virtual DataStatus Arc::DataPoint::CompareLocationMetadata () const` [pure virtual]

Compare metadata of [DataPoint](#) and current location.

Returns inconsistency error or error encountered during operation, or success

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.14** `virtual bool Arc::DataPoint::CompareMeta (const DataPoint & p) const` [virtual]

Compare meta information from another object.

Undefined values are not used for comparison.

**Parameters:**

*p* object to which to compare.

**4.10.4.15** `virtual const URL& Arc::DataPoint::CurrentLocation () const` [pure virtual]

Returns current (resolved) URL.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.16** `virtual const std::string& Arc::DataPoint::CurrentLocationMetadata () const` [pure virtual]

Returns meta information used to create current URL.

Usage differs between different indexing services.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.17** `virtual const std::string Arc::DataPoint::DefaultChecksum () const` [virtual]

Default checksum type.

**4.10.4.18** `virtual DataStatus Arc::DataPoint::FinishReading (bool error = false)` [virtual]

Finish reading from the URL.

Must be called after transfer of physical file has completed and if [PrepareReading\(\)](#) was called, to free resources, release requests that were made during preparation etc.

**Parameters:**

*error* If true then action is taken depending on the error.

Reimplemented in [Arc::DataPointIndex](#).

#### 4.10.4.19 virtual [DataStatus](#) Arc::DataPoint::FinishWriting (bool *error* = false) [virtual]

Finish writing to the URL.

Must be called after transfer of physical file has completed and if [PrepareWriting\(\)](#) was called, to free resources, release requests that were made during preparation etc.

**Parameters:**

*error* If true then action is taken depending on the error.

Reimplemented in [Arc::DataPointIndex](#).

#### 4.10.4.20 virtual [DataPointAccessLatency](#) Arc::DataPoint::GetAccessLatency () const [virtual]

Get value of meta-information 'access latency'.

Reimplemented in [Arc::DataPointIndex](#).

#### 4.10.4.21 virtual bool Arc::DataPoint::GetAdditionalChecks () const [pure virtual]

Check if additional checks before transfer will be performed.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

#### 4.10.4.22 virtual const std::string& Arc::DataPoint::GetChecksum () const [virtual]

Get value of meta-information 'checksum'.

#### 4.10.4.23 virtual const [Checksum](#)\* Arc::DataPoint::GetChecksumObject (int *index*) const [pure virtual]

Get [Checksum](#) object at given position in list.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

#### 4.10.4.24 virtual const Time& Arc::DataPoint::GetCreated () const [virtual]

Get value of meta-information 'creation/modification time'.

**4.10.4.25** virtual [DataStatus](#) [Arc::DataPoint::GetFailureReason](#) (void) const [virtual]

Returns reason of transfer failure, as reported by callbacks. This could be different from the failure returned by the methods themselves.

**4.10.4.26** virtual bool [Arc::DataPoint::GetSecure](#) () const [pure virtual]

Check if heavy security during data transfer is allowed.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.27** virtual unsigned long long int [Arc::DataPoint::GetSize](#) () const [virtual]

Get value of meta-information 'size'.

**4.10.4.28** virtual int [Arc::DataPoint::GetTries](#) () const [virtual]

Returns number of retries left.

**4.10.4.29** virtual const URL& [Arc::DataPoint::GetURL](#) () const [virtual]

Returns the URL that was passed to the constructor.

**4.10.4.30** virtual const UserConfig& [Arc::DataPoint::GetUserConfig](#) () const [virtual]

Returns the UserConfig that was passed to the constructor.

**4.10.4.31** virtual const Time& [Arc::DataPoint::GetValid](#) () const [virtual]

Get value of meta-information 'validity time'.

**4.10.4.32** virtual bool [Arc::DataPoint::HaveLocations](#) () const [pure virtual]

Returns true if number of resolved URLs is not 0.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.33** virtual bool [Arc::DataPoint::IsIndex](#) () const [pure virtual]

Check if URL is an Indexing Service.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.34** virtual bool [Arc::DataPoint::IsStageable](#) () const [virtual]

If URL should be staged or queried for Transport URL (TURL).

Reimplemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.35 virtual bool Arc::DataPoint::LastLocation () [pure virtual]**

Returns true if the current location is the last.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.36 virtual DataStatus Arc::DataPoint::List (std::list< FileInfo > &files, DataPointInfoType verb = INFO\_TYPE\_ALL) [pure virtual]**

List hierarchical content of this object.

If the [DataPoint](#) represents a directory or something similar its contents will be listed.

**Parameters:**

*files* will contain list of file names and requested attributes. There may be more attributes than requested. There may be less if object can't provide particular information.

*verb* defines attribute types which method must try to retrieve. It is not a failure if some attributes could not be retrieved due to limitation of protocol or access control.

**4.10.4.37 virtual bool Arc::DataPoint::Local () const [pure virtual]**

Returns true if file is local, e.g. file:// urls.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.38 virtual bool Arc::DataPoint::LocationValid () const [pure virtual]**

Returns false if out of retries.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.39 virtual bool Arc::DataPoint::NextLocation () [pure virtual]**

Switch to next location in list of URLs.

At last location switch to first if number of allowed retries is not exceeded. Returns false if no retries left.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.40 virtual void Arc::DataPoint::NextTry (void) [virtual]**

Decrease number of retries left.

**4.10.4.41 virtual Arc::DataPoint::operator bool () const [virtual]**

Is [DataPoint](#) valid?

**4.10.4.42 virtual bool Arc::DataPoint::operator! () const [virtual]**

Is [DataPoint](#) valid?

#### 4.10.4.43 **virtual void Arc::DataPoint::Passive (bool v) [pure virtual]**

Request passive transfers for FTP-like protocols.

##### Parameters:

*true* to request.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

#### 4.10.4.44 **virtual [DataStatus](#) Arc::DataPoint::PostRegister (bool replication) [pure virtual]**

Index Service postregistration.

Used for same purpose as PreRegister. Should be called after actual transfer of file successfully finished.

##### Parameters:

*replication* if true, the file is being replicated between two locations registered in Indexing Service under same name.

Implemented in [Arc::DataPointDirect](#).

#### 4.10.4.45 **virtual [DataStatus](#) Arc::DataPoint::PrepareReading (unsigned int timeout, unsigned int & wait\_time, const std::list< std::string > & transport\_protocols) [virtual]**

Prepare [DataPoint](#) for reading.

This method should be implemented by protocols which require preparation or staging of physical files for reading. It can act synchronously or asynchronously (if protocol supports it). In the first case the method will block until the file is prepared or the specified timeout has passed. In the second case the method can return with a ReadPrepareWait status before the file is prepared. The caller should then wait some time (a hint from the remote service may be given in wait\_time) and call [PrepareReading\(\)](#) again to poll for the preparation status, until the file is prepared. In this case it is also up to the caller to decide when the request has taken too long and if so cancel it by calling [FinishReading\(\)](#). When file preparation has finished, the physical file(s) to read from can be found from [TransferLocations\(\)](#).

##### Parameters:

*timeout* If non-zero, this method will block until either the file has been prepared successfully or the timeout has passed. A zero value means that the caller would like to call and poll for status.

*wait\_time* If timeout is zero (caller would like asynchronous operation) and ReadPrepareWait is returned, a hint for how long to wait before a subsequent call may be given in wait\_time.

*transport\_protocols* A list of possible transport protocols for the physical file in order of preference.

Reimplemented in [Arc::DataPointIndex](#).

#### 4.10.4.46 **virtual [DataStatus](#) Arc::DataPoint::PrepareWriting (unsigned int timeout, unsigned int & wait\_time, const std::list< std::string > & transport\_protocols) [virtual]**

Prepare [DataPoint](#) for writing.

This method should be implemented by protocols which require preparation of physical files for writing. It can act synchronously or asynchronously (if protocol supports it). In the first case the method will block

until the file is prepared or the specified timeout has passed. In the second case the method can return with a WritePrepareWait status before the file is prepared. The caller should then wait some time (a hint from the remote service may be given in wait\_time) and call [PrepareWriting\(\)](#) again to poll for the preparation status, until the file is prepared. In this case it is also up to the caller to decide when the request has taken too long and if so cancel or abort it by calling [FinishWriting\(true\)](#). When file preparation has finished, the physical file(s) to write to can be found from [TransferLocations\(\)](#).

#### Parameters:

**timeout** If non-zero, this method will block until either the file has been prepared successfully or the timeout has passed. A zero value means that the caller would like to call and poll for status.

**wait\_time** If timeout is zero (caller would like asynchronous operation) and WritePrepareWait is returned, a hint for how long to wait before a subsequent call may be given in wait\_time.

**transport\_protocols** A list of possible transport protocols for the physical file in order of preference.

Reimplemented in [Arc::DataPointIndex](#).

#### 4.10.4.47 virtual [DataStatus](#) Arc::DataPoint::PreRegister (bool replication, bool force = false) [pure virtual]

Index service preregistration.

This function registers the physical location of a file into an indexing service. It should be called \*before\* the actual transfer to that location happens.

#### Parameters:

**replication** if true, the file is being replicated between two locations registered in the indexing service under same name.

**force** if true, perform registration of a new file even if it already exists. Should be used to fix failures in Indexing Service.

Implemented in [Arc::DataPointDirect](#).

#### 4.10.4.48 virtual [DataStatus](#) Arc::DataPoint::PreUnregister (bool replication) [pure virtual]

Index Service preunregistration.

Should be called if file transfer failed. It removes changes made by PreRegister.

#### Parameters:

**replication** if true, the file is being replicated between two locations registered in Indexing Service under same name.

Implemented in [Arc::DataPointDirect](#).

#### 4.10.4.49 virtual bool Arc::DataPoint::ProvidesMeta () const [pure virtual]

If endpoint can provide at least some meta information directly.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.50** `virtual void Arc::DataPoint::Range (unsigned long long int start = 0, unsigned long long int end = 0) [pure virtual]`

Set range of bytes to retrieve.

Default values correspond to whole file.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.51** `virtual void Arc::DataPoint::ReadOutOfOrder (bool v) [pure virtual]`

**Parameters:**

*v* true if allowed (default is false).

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.52** `virtual bool Arc::DataPoint::Registered () const [pure virtual]`

Check if file is registered in Indexing Service.

Proper value is obtainable only after Resolve.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.53** `virtual DataStatus Arc::DataPoint::Remove () [pure virtual]`

Remove/delete object at URL.

Implemented in [Arc::DataPointIndex](#).

**4.10.4.54** `virtual DataStatus Arc::DataPoint::RemoveLocation () [pure virtual]`

Remove current URL from list.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.55** `virtual DataStatus Arc::DataPoint::RemoveLocations (const DataPoint & p) [pure virtual]`

Remove locations present in another [DataPoint](#) object.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.56** `virtual DataStatus Arc::DataPoint::Resolve (bool source) [pure virtual]`

Resolves index service URL into list of ordinary URLs.

Also obtains meta information about the file.

**Parameters:**

*source* true if [DataPoint](#) object represents source of information.

Implemented in [Arc::DataPointDirect](#).

**4.10.4.57 virtual void Arc::DataPoint::SetAccessLatency (const [DataPointAccessLatency](#) & latency) [virtual]**

Set value of meta-information 'access latency'.

**4.10.4.58 virtual void Arc::DataPoint::SetAdditionalChecks (bool v) [pure virtual]**

Allow/disallow additional checks.

Check for existence of remote file (and probably other checks too) before initiating reading and writing operations.

**Parameters:**

*v* true if allowed (default is true).

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.59 virtual void Arc::DataPoint::SetChecksum (const std::string & val) [virtual]**

Set value of meta-information 'checksum'.

Reimplemented in [Arc::DataPointIndex](#).

**4.10.4.60 virtual void Arc::DataPoint::SetCreated (const Time & val) [virtual]**

Set value of meta-information 'creation/modification time'.

**4.10.4.61 virtual void Arc::DataPoint::SetMeta (const [DataPoint](#) & p) [virtual]**

Copy meta information from another object.

Already defined values are not overwritten.

**Parameters:**

*p* object from which information is taken.

Reimplemented in [Arc::DataPointIndex](#).

**4.10.4.62 virtual void Arc::DataPoint::SetSecure (bool v) [pure virtual]**

Allow/disallow heavy security during data transfer.

**Parameters:**

*v* true if allowed (default depends on protocol).

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.63 virtual void Arc::DataPoint::SetSize (const unsigned long long int val) [virtual]**

Set value of meta-information 'size'.

Reimplemented in [Arc::DataPointIndex](#).

**4.10.4.64 virtual void Arc::DataPoint::SetTries (const int *n*) [virtual]**

Set number of retries.

Reimplemented in [Arc::DataPointIndex](#).

**4.10.4.65 virtual bool Arc::DataPoint::SetURL (const URL & *url*) [virtual]**

Assigns new URL. Main purpose of this method is to reuse existing connection for accessing different object at same server. Implementation does not have to implement this method. If supplied URL is not suitable or method is not implemented false is returned.

**4.10.4.66 virtual void Arc::DataPoint::SetValid (const Time & *val*) [virtual]**

Set value of meta-information 'validity time'.

**4.10.4.67 virtual void Arc::DataPoint::SortLocations (const std::string & *pattern*, const URLMap & *url\_map*) [pure virtual]**

Sort locations according to the specified pattern.

**Parameters:**

*pattern* a set of strings, separated by |, to match against.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.4.68 virtual [DataStatus](#) Arc::DataPoint::StartReading ([DataBuffer](#) & *buffer*) [pure virtual]**

Start reading data from URL.

Separate thread to transfer data will be created. No other operation can be performed while reading is in progress.

**Parameters:**

*buffer* operation will use this buffer to put information into. Should not be destroyed before [Stop-Reading\(\)](#) was called and returned.

Implemented in [Arc::DataPointIndex](#).

**4.10.4.69 virtual [DataStatus](#) Arc::DataPoint::StartWriting ([DataBuffer](#) & *buffer*, [DataCallback](#) \* *space\_cb* = NULL) [pure virtual]**

Start writing data to URL.

Separate thread to transfer data will be created. No other operation can be performed while writing is in progress.

**Parameters:**

*buffer* operation will use this buffer to get information from. Should not be destroyed before *stop\_*-writing was called and returned.

*space\_cb* callback which is called if there is not enough space to store data. May not implemented for all protocols.

Implemented in [Arc::DataPointIndex](#).

**4.10.4.70** `virtual DataStatus Arc::DataPoint::Stat (FileInfo &file, DataPointInfoType verb = INFO_TYPE_ALL)` [pure virtual]

Retrieve information about this object.

If the [DataPoint](#) represents a directory or something similar, information about the object itself and not its contents will be obtained.

**Parameters:**

*file* will contain object name and requested attributes. There may be more attributes than requested. There may be less if object can't provide particular information.

*verb* defines attribute types which method must try to retrieve. It is not a failure if some attributes could not be retrieved due to limitation of protocol or access control.

**4.10.4.71** `virtual DataStatus Arc::DataPoint::StopReading ()` [pure virtual]

Stop reading.

Must be called after corresponding start\_reading method, either after all data is transferred or to cancel transfer. Use buffer object to find out when data is transferred. Must return failure if any happened during transfer.

Implemented in [Arc::DataPointIndex](#).

**4.10.4.72** `virtual DataStatus Arc::DataPoint::StopWriting ()` [pure virtual]

Stop writing.

Must be called after corresponding start\_writing method, either after all data is transferred or to cancel transfer. Use buffer object to find out when data is transferred. Must return failure if any happened during transfer.

Implemented in [Arc::DataPointIndex](#).

**4.10.4.73** `virtual std::string Arc::DataPoint::str () const` [virtual]

Returns a string representation of the [DataPoint](#).

**4.10.4.74** `virtual std::vector<URL> Arc::DataPoint::TransferLocations () const` [virtual]

Returns physical file(s) to read/write, if different from [CurrentLocation\(\)](#).

To be used with protocols which re-direct to different URLs such as Transport URLs (TURLs). The list is initially filled by PrepareReading and PrepareWriting. If this list is non-empty then real transfer should use a URL from this list. It is up to the caller to choose the best URL and instantiate new [DataPoint](#) for handling it. For consistency protocols which do not require redirections return original URL. For protocols which need redirection calling StartReading and StartWriting will use first URL in the list.

Reimplemented in [Arc::DataPointIndex](#).

**4.10.4.75** virtual [DataStatus](#) [Arc::DataPoint::Unregister](#) (bool *all*) [pure virtual]

Index Service unregistration.

Remove information about file registered in Indexing Service.

**Parameters:**

*all* if true, information about file itself is (LFN) is removed. Otherwise only particular physical instance is unregistered.

Implemented in [Arc::DataPointDirect](#).

**4.10.4.76** virtual bool [Arc::DataPoint::WriteOutOfOrder](#) () [pure virtual]

Returns true if URL can accept scattered data for \*writing\* operation.

Implemented in [Arc::DataPointDirect](#), and [Arc::DataPointIndex](#).

**4.10.5 Field Documentation****4.10.5.1** std::list<std::string> [Arc::DataPoint::valid\\_url\\_options](#) [protected]

Subclasses should add their own specific options to this list

### 4.11.1 Detailed Description

This is a kind of generalized file handle.

Differently from file handle it does not support operations `read()` and `write()`. Instead it initiates operation and uses object of class [DataBuffer](#) to pass actual data. It also provides other operations like querying parameters of remote object. It is used by higher-level classes `DataMove` and `DataMovePar` to provide data transfer service for application.

### 4.11.2 Member Function Documentation

#### 4.11.2.1 `virtual bool Arc::DataPointDirect::AcceptsMeta () const` [virtual]

If endpoint can have any use from meta information.

Implements [Arc::DataPoint](#).

#### 4.11.2.2 `virtual int Arc::DataPointDirect::AddChecksumObject (Checksum * cksum)` [virtual]

Add a checksum object which will compute checksum during transmission.

##### Parameters:

*cksum* object which will compute checksum. Should not be destroyed till `DataPointer` itself.

##### Returns:

integer position in the list of checksum objects.

Implements [Arc::DataPoint](#).

#### 4.11.2.3 `virtual DataStatus Arc::DataPointDirect::AddLocation (const URL & url, const std::string & meta)` [virtual]

Add URL to list.

##### Parameters:

*url* Location URL to add.

*meta* Location meta information.

Implements [Arc::DataPoint](#).

#### 4.11.2.4 `virtual int Arc::DataPointDirect::BufNum () const` [virtual]

Get suggested number of buffers for transfers.

Implements [Arc::DataPoint](#).

#### 4.11.2.5 `virtual long long int Arc::DataPointDirect::BufSize () const` [virtual]

Get suggested buffer size for transfers.

Implements [Arc::DataPoint](#).

**4.11.2.6 virtual [DataStatus](#) Arc::DataPointDirect::ClearLocations () [virtual]**

Remove all locations.

Implements [Arc::DataPoint](#).

**4.11.2.7 virtual [DataStatus](#) Arc::DataPointDirect::CompareLocationMetadata () const [virtual]**

Compare metadata of [DataPoint](#) and current location.

Returns inconsistency error or error encountered during operation, or success

Implements [Arc::DataPoint](#).

**4.11.2.8 virtual const URL& Arc::DataPointDirect::CurrentLocation () const [virtual]**

Returns current (resolved) URL.

Implements [Arc::DataPoint](#).

**4.11.2.9 virtual const std::string& Arc::DataPointDirect::CurrentLocationMetadata () const [virtual]**

Returns meta information used to create current URL.

Usage differs between different indexing services.

Implements [Arc::DataPoint](#).

**4.11.2.10 virtual bool Arc::DataPointDirect::GetAdditionalChecks () const [virtual]**

Check if additional checks before transfer will be performed.

Implements [Arc::DataPoint](#).

**4.11.2.11 virtual const [Checksum](#)\* Arc::DataPointDirect::GetChecksumObject (int *index*) const [virtual]**

Get [Checksum](#) object at given position in list.

Implements [Arc::DataPoint](#).

**4.11.2.12 virtual bool Arc::DataPointDirect::GetSecure () const [virtual]**

Check if heavy security during data transfer is allowed.

Implements [Arc::DataPoint](#).

**4.11.2.13 virtual bool Arc::DataPointDirect::HaveLocations () const [virtual]**

Returns true if number of resolved URLs is not 0.

Implements [Arc::DataPoint](#).

**4.11.2.14 virtual bool Arc::DataPointDirect::IsIndex () const** [virtual]

Check if URL is an Indexing Service.

Implements [Arc::DataPoint](#).

**4.11.2.15 virtual bool Arc::DataPointDirect::IsStageable () const** [virtual]

If URL should be staged or queried for Transport URL (TURL).

Reimplemented from [Arc::DataPoint](#).

**4.11.2.16 virtual bool Arc::DataPointDirect::LastLocation ()** [virtual]

Returns true if the current location is the last.

Implements [Arc::DataPoint](#).

**4.11.2.17 virtual bool Arc::DataPointDirect::Local () const** [virtual]

Returns true if file is local, e.g. file:// urls.

Implements [Arc::DataPoint](#).

**4.11.2.18 virtual bool Arc::DataPointDirect::LocationValid () const** [virtual]

Returns false if out of retries.

Implements [Arc::DataPoint](#).

**4.11.2.19 virtual bool Arc::DataPointDirect::NextLocation ()** [virtual]

Switch to next location in list of URLs.

At last location switch to first if number of allowed retries is not exceeded. Returns false if no retries left.

Implements [Arc::DataPoint](#).

**4.11.2.20 virtual void Arc::DataPointDirect::Passive (bool v)** [virtual]

Request passive transfers for FTP-like protocols.

**Parameters:**

*true* to request.

Implements [Arc::DataPoint](#).

**4.11.2.21 virtual [DataStatus](#) Arc::DataPointDirect::PostRegister (bool *replication*)** [virtual]

Index Service postregistration.

Used for same purpose as PreRegister. Should be called after actual transfer of file successfully finished.

**Parameters:**

*replication* if true, the file is being replicated between two locations registered in Indexing Service under same name.

Implements [Arc::DataPoint](#).

**4.11.2.22** `virtual DataStatus Arc::DataPointDirect::PreRegister (bool replication, bool force = false) [virtual]`

Index service preregistration.

This function registers the physical location of a file into an indexing service. It should be called *\*before\** the actual transfer to that location happens.

**Parameters:**

*replication* if true, the file is being replicated between two locations registered in the indexing service under same name.

*force* if true, perform registration of a new file even if it already exists. Should be used to fix failures in Indexing Service.

Implements [Arc::DataPoint](#).

**4.11.2.23** `virtual DataStatus Arc::DataPointDirect::PreUnregister (bool replication) [virtual]`

Index Service preunregistration.

Should be called if file transfer failed. It removes changes made by PreRegister.

**Parameters:**

*replication* if true, the file is being replicated between two locations registered in Indexing Service under same name.

Implements [Arc::DataPoint](#).

**4.11.2.24** `virtual bool Arc::DataPointDirect::ProvidesMeta () const [virtual]`

If endpoint can provide at least some meta information directly.

Implements [Arc::DataPoint](#).

**4.11.2.25** `virtual void Arc::DataPointDirect::Range (unsigned long long int start = 0, unsigned long long int end = 0) [virtual]`

Set range of bytes to retrieve.

Default values correspond to whole file.

Implements [Arc::DataPoint](#).

**4.11.2.26 virtual void Arc::DataPointDirect::ReadOutOfOrder (bool *v*)** [virtual]**Parameters:**

*v* true if allowed (default is false).

Implements [Arc::DataPoint](#).

**4.11.2.27 virtual bool Arc::DataPointDirect::Registered () const** [virtual]

Check if file is registered in Indexing Service.

Proper value is obtainable only after Resolve.

Implements [Arc::DataPoint](#).

**4.11.2.28 virtual [DataStatus](#) Arc::DataPointDirect::RemoveLocation ()** [virtual]

Remove current URL from list.

Implements [Arc::DataPoint](#).

**4.11.2.29 virtual [DataStatus](#) Arc::DataPointDirect::RemoveLocations (const [DataPoint](#) & *p*)**  
[virtual]

Remove locations present in another [DataPoint](#) object.

Implements [Arc::DataPoint](#).

**4.11.2.30 virtual [DataStatus](#) Arc::DataPointDirect::Resolve (bool *source*)** [virtual]

Resolves index service URL into list of ordinary URLs.

Also obtains meta information about the file.

**Parameters:**

*source* true if [DataPoint](#) object represents source of information.

Implements [Arc::DataPoint](#).

**4.11.2.31 virtual void Arc::DataPointDirect::SetAdditionalChecks (bool *v*)** [virtual]

Allow/disallow additional checks.

Check for existence of remote file (and probably other checks too) before initiating reading and writing operations.

**Parameters:**

*v* true if allowed (default is true).

Implements [Arc::DataPoint](#).

**4.11.2.32 virtual void Arc::DataPointDirect::SetSecure (bool *v*)** [virtual]

Allow/disallow heavy security during data transfer.

**Parameters:**

*v* true if allowed (default depends on protocol).

Implements [Arc::DataPoint](#).

**4.11.2.33 virtual void Arc::DataPointDirect::SortLocations (const std::string &, const URLMap &)** [inline, virtual]

Sort locations according to the specified pattern.

**Parameters:**

*pattern* a set of strings, separated by |, to match against.

Implements [Arc::DataPoint](#).

**4.11.2.34 virtual [DataStatus](#) Arc::DataPointDirect::Unregister (bool *all*)** [virtual]

Index Service unregistration.

Remove information about file registered in Indexing Service.

**Parameters:**

*all* if true, information about file itself is (LFN) is removed. Otherwise only particular physical instance is unregistered.

Implements [Arc::DataPoint](#).

**4.11.2.35 virtual bool Arc::DataPointDirect::WriteOutOfOrder ()** [virtual]

Returns true if URL can accept scattered data for \*writing\* operation.

Implements [Arc::DataPoint](#).

The documentation for this class was generated from the following file:

- DataPointDirect.h

## 4.12 Arc::DataPointIndex Class Reference

Complements [DataPoint](#) with attributes common for Indexing Service URLs.

```

### 4.12.1 Detailed Description

Complements [DataPoint](#) with attributes common for Indexing Service URLs.

It should never be used directly. Instead inherit from it to provide a class for specific a Indexing Service.

### 4.12.2 Member Function Documentation

#### 4.12.2.1 virtual bool Arc::DataPointIndex::AcceptsMeta () const [virtual]

If endpoint can have any use from meta information.

Implements [Arc::DataPoint](#).

#### 4.12.2.2 virtual int Arc::DataPointIndex::AddChecksumObject ([Checksum](#) \* cksum) [virtual]

Add a checksum object which will compute checksum during transmission.

##### Parameters:

*cksum* object which will compute checksum. Should not be destroyed till DataPointer itself.

##### Returns:

integer position in the list of checksum objects.

Implements [Arc::DataPoint](#).

#### 4.12.2.3 virtual [DataStatus](#) Arc::DataPointIndex::AddLocation (const URL & url, const std::string & meta) [virtual]

Add URL to list.

##### Parameters:

*url* Location URL to add.

*meta* Location meta information.

Implements [Arc::DataPoint](#).

#### 4.12.2.4 **virtual int Arc::DataPointIndex::BufNum () const** [virtual]

Get suggested number of buffers for transfers.

Implements [Arc::DataPoint](#).

#### 4.12.2.5 **virtual long long int Arc::DataPointIndex::BufSize () const** [virtual]

Get suggested buffer size for transfers.

Implements [Arc::DataPoint](#).

#### 4.12.2.6 **virtual DataStatus Arc::DataPointIndex::Check ()** [virtual]

Query the [DataPoint](#) to check if object is accessible.

If possible this method will also try to provide meta information about the object. It returns positive response if object's content can be retrieved.

Implements [Arc::DataPoint](#).

#### 4.12.2.7 **virtual DataStatus Arc::DataPointIndex::ClearLocations ()** [virtual]

Remove all locations.

Implements [Arc::DataPoint](#).

#### 4.12.2.8 **virtual DataStatus Arc::DataPointIndex::CompareLocationMetadata () const** [virtual]

Compare metadata of [DataPoint](#) and current location.

Returns inconsistency error or error encountered during operation, or success

Implements [Arc::DataPoint](#).

#### 4.12.2.9 **virtual const URL& Arc::DataPointIndex::CurrentLocation () const** [virtual]

Returns current (resolved) URL.

Implements [Arc::DataPoint](#).

#### 4.12.2.10 **virtual const std::string& Arc::DataPointIndex::CurrentLocationMetadata () const** [virtual]

Returns meta information used to create current URL.

Usage differs between different indexing services.

Implements [Arc::DataPoint](#).

**4.12.2.11** virtual [DataStatus](#) Arc::DataPointIndex::FinishReading (bool *error* = false)  
[virtual]

Finish reading from the URL.

Must be called after transfer of physical file has completed and if [PrepareReading\(\)](#) was called, to free resources, release requests that were made during preparation etc.

**Parameters:**

*error* If true then action is taken depending on the error.

Reimplemented from [Arc::DataPoint](#).

**4.12.2.12** virtual [DataStatus](#) Arc::DataPointIndex::FinishWriting (bool *error* = false)  
[virtual]

Finish writing to the URL.

Must be called after transfer of physical file has completed and if [PrepareWriting\(\)](#) was called, to free resources, release requests that were made during preparation etc.

**Parameters:**

*error* If true then action is taken depending on the error.

Reimplemented from [Arc::DataPoint](#).

**4.12.2.13** virtual [DataPointAccessLatency](#) Arc::DataPointIndex::GetAccessLatency () const  
[virtual]

Get value of meta-information 'access latency'.

Reimplemented from [Arc::DataPoint](#).

**4.12.2.14** virtual bool Arc::DataPointIndex::GetAdditionalChecks () const [virtual]

Check if additional checks before transfer will be performed.

Implements [Arc::DataPoint](#).

**4.12.2.15** virtual const [Checksum](#)\* Arc::DataPointIndex::GetChecksumObject (int *index*) const  
[virtual]

Get [Checksum](#) object at given position in list.

Implements [Arc::DataPoint](#).

**4.12.2.16** virtual bool Arc::DataPointIndex::GetSecure () const [virtual]

Check if heavy security during data transfer is allowed.

Implements [Arc::DataPoint](#).

**4.12.2.17 virtual bool Arc::DataPointIndex::HaveLocations () const** [virtual]

Returns true if number of resolved URLs is not 0.

Implements [Arc::DataPoint](#).

**4.12.2.18 virtual bool Arc::DataPointIndex::IsIndex () const** [virtual]

Check if URL is an Indexing Service.

Implements [Arc::DataPoint](#).

**4.12.2.19 virtual bool Arc::DataPointIndex::IsStageable () const** [virtual]

If URL should be staged or queried for Transport URL (TURL).

Reimplemented from [Arc::DataPoint](#).

**4.12.2.20 virtual bool Arc::DataPointIndex::LastLocation ()** [virtual]

Returns true if the current location is the last.

Implements [Arc::DataPoint](#).

**4.12.2.21 virtual bool Arc::DataPointIndex::Local () const** [virtual]

Returns true if file is local, e.g. file:// urls.

Implements [Arc::DataPoint](#).

**4.12.2.22 virtual bool Arc::DataPointIndex::LocationValid () const** [virtual]

Returns false if out of retries.

Implements [Arc::DataPoint](#).

**4.12.2.23 virtual bool Arc::DataPointIndex::NextLocation ()** [virtual]

Switch to next location in list of URLs.

At last location switch to first if number of allowed retries is not exceeded. Returns false if no retries left.

Implements [Arc::DataPoint](#).

**4.12.2.24 virtual void Arc::DataPointIndex::Passive (bool v)** [virtual]

Request passive transfers for FTP-like protocols.

**Parameters:**

*true* to request.

Implements [Arc::DataPoint](#).

#### 4.12.2.25 **virtual [DataStatus](#) Arc::DataPointIndex::PrepareReading (unsigned int *timeout*, unsigned int & *wait\_time*, const std::list< std::string > & *transport\_protocols*)** [virtual]

Prepare [DataPoint](#) for reading.

This method should be implemented by protocols which require preparation or staging of physical files for reading. It can act synchronously or asynchronously (if protocol supports it). In the first case the method will block until the file is prepared or the specified timeout has passed. In the second case the method can return with a ReadPrepareWait status before the file is prepared. The caller should then wait some time (a hint from the remote service may be given in *wait\_time*) and call [PrepareReading\(\)](#) again to poll for the preparation status, until the file is prepared. In this case it is also up to the caller to decide when the request has taken too long and if so cancel it by calling [FinishReading\(\)](#). When file preparation has finished, the physical file(s) to read from can be found from [TransferLocations\(\)](#).

##### Parameters:

- timeout*** If non-zero, this method will block until either the file has been prepared successfully or the timeout has passed. A zero value means that the caller would like to call and poll for status.
- wait\_time*** If timeout is zero (caller would like asynchronous operation) and ReadPrepareWait is returned, a hint for how long to wait before a subsequent call may be given in *wait\_time*.
- transport\_protocols*** A list of possible transport protocols for the physical file in order of preference.

Reimplemented from [Arc::DataPoint](#).

#### 4.12.2.26 **virtual [DataStatus](#) Arc::DataPointIndex::PrepareWriting (unsigned int *timeout*, unsigned int & *wait\_time*, const std::list< std::string > & *transport\_protocols*)** [virtual]

Prepare [DataPoint](#) for writing.

This method should be implemented by protocols which require preparation of physical files for writing. It can act synchronously or asynchronously (if protocol supports it). In the first case the method will block until the file is prepared or the specified timeout has passed. In the second case the method can return with a WritePrepareWait status before the file is prepared. The caller should then wait some time (a hint from the remote service may be given in *wait\_time*) and call [PrepareWriting\(\)](#) again to poll for the preparation status, until the file is prepared. In this case it is also up to the caller to decide when the request has taken too long and if so cancel or abort it by calling [FinishWriting\(true\)](#). When file preparation has finished, the physical file(s) to write to can be found from [TransferLocations\(\)](#).

##### Parameters:

- timeout*** If non-zero, this method will block until either the file has been prepared successfully or the timeout has passed. A zero value means that the caller would like to call and poll for status.
- wait\_time*** If timeout is zero (caller would like asynchronous operation) and WritePrepareWait is returned, a hint for how long to wait before a subsequent call may be given in *wait\_time*.
- transport\_protocols*** A list of possible transport protocols for the physical file in order of preference.

Reimplemented from [Arc::DataPoint](#).

#### 4.12.2.27 **virtual bool Arc::DataPointIndex::ProvidesMeta () const** [virtual]

If endpoint can provide at least some meta information directly.

Implements [Arc::DataPoint](#).

**4.12.2.28** `virtual void Arc::DataPointIndex::Range (unsigned long long int start = 0, unsigned long long int end = 0) [virtual]`

Set range of bytes to retrieve.

Default values correspond to whole file.

Implements [Arc::DataPoint](#).

**4.12.2.29** `virtual void Arc::DataPointIndex::ReadOutOfOrder (bool v) [virtual]`

**Parameters:**

*v* true if allowed (default is false).

Implements [Arc::DataPoint](#).

**4.12.2.30** `virtual bool Arc::DataPointIndex::Registered () const [virtual]`

Check if file is registered in Indexing Service.

Proper value is obtainable only after Resolve.

Implements [Arc::DataPoint](#).

**4.12.2.31** `virtual DataStatus Arc::DataPointIndex::Remove () [virtual]`

Remove/delete object at URL.

Implements [Arc::DataPoint](#).

**4.12.2.32** `virtual DataStatus Arc::DataPointIndex::RemoveLocation () [virtual]`

Remove current URL from list.

Implements [Arc::DataPoint](#).

**4.12.2.33** `virtual DataStatus Arc::DataPointIndex::RemoveLocations (const DataPoint & p) [virtual]`

Remove locations present in another [DataPoint](#) object.

Implements [Arc::DataPoint](#).

**4.12.2.34** `virtual void Arc::DataPointIndex::SetAdditionalChecks (bool v) [virtual]`

Allow/disallow additional checks.

Check for existence of remote file (and probably other checks too) before initiating reading and writing operations.

**Parameters:**

*v* true if allowed (default is true).

Implements [Arc::DataPoint](#).

**4.12.2.35 virtual void Arc::DataPointIndex::SetChecksum (const std::string & *val*) [virtual]**

Set value of meta-information 'checksum'.

Reimplemented from [Arc::DataPoint](#).

**4.12.2.36 virtual void Arc::DataPointIndex::SetMeta (const [DataPoint](#) & *p*) [virtual]**

Copy meta information from another object.

Already defined values are not overwritten.

**Parameters:**

*p* object from which information is taken.

Reimplemented from [Arc::DataPoint](#).

**4.12.2.37 virtual void Arc::DataPointIndex::SetSecure (bool *v*) [virtual]**

Allow/disallow heavy security during data transfer.

**Parameters:**

*v* true if allowed (default depends on protocol).

Implements [Arc::DataPoint](#).

**4.12.2.38 virtual void Arc::DataPointIndex::SetSize (const unsigned long long int *val*) [virtual]**

Set value of meta-information 'size'.

Reimplemented from [Arc::DataPoint](#).

**4.12.2.39 virtual void Arc::DataPointIndex::SetTries (const int *n*) [virtual]**

Set number of retries.

Reimplemented from [Arc::DataPoint](#).

**4.12.2.40 virtual void Arc::DataPointIndex::SortLocations (const std::string & *pattern*, const URLMap & *url\_map*) [virtual]**

Sort locations according to the specified pattern.

**Parameters:**

*pattern* a set of strings, separated by |, to match against.

Implements [Arc::DataPoint](#).

**4.12.2.41** `virtual DataStatus Arc::DataPointIndex::StartReading (DataBuffer & buffer)`  
[virtual]

Start reading data from URL.

Separate thread to transfer data will be created. No other operation can be performed while reading is in progress.

**Parameters:**

*buffer* operation will use this buffer to put information into. Should not be destroyed before [StopReading\(\)](#) was called and returned.

Implements [Arc::DataPoint](#).

**4.12.2.42** `virtual DataStatus Arc::DataPointIndex::StartWriting (DataBuffer & buffer, DataCallback * space_cb = NULL)` [virtual]

Start writing data to URL.

Separate thread to transfer data will be created. No other operation can be performed while writing is in progress.

**Parameters:**

*buffer* operation will use this buffer to get information from. Should not be destroyed before `stop_writing` was called and returned.

*space\_cb* callback which is called if there is not enough space to store data. May not implemented for all protocols.

Implements [Arc::DataPoint](#).

**4.12.2.43** `virtual DataStatus Arc::DataPointIndex::StopReading ()` [virtual]

Stop reading.

Must be called after corresponding `start_reading` method, either after all data is transferred or to cancel transfer. Use buffer object to find out when data is transferred. Must return failure if any happened during transfer.

Implements [Arc::DataPoint](#).

**4.12.2.44** `virtual DataStatus Arc::DataPointIndex::StopWriting ()` [virtual]

Stop writing.

Must be called after corresponding `start_writing` method, either after all data is transferred or to cancel transfer. Use buffer object to find out when data is transferred. Must return failure if any happened during transfer.

Implements [Arc::DataPoint](#).

**4.12.2.45** `virtual std::vector<URL> Arc::DataPointIndex::TransferLocations () const`  
[virtual]

Returns physical file(s) to read/write, if different from [CurrentLocation\(\)](#).

To be used with protocols which re-direct to different URLs such as Transport URLs (TURLs). The list is initially filled by PrepareReading and PrepareWriting. If this list is non-empty then real transfer should use a URL from this list. It is up to the caller to choose the best URL and instantiate new [DataPoint](#) for handling it. For consistency protocols which do not require redirections return original URL. For protocols which need redirection calling StartReading and StartWriting will use first URL in the list.

Reimplemented from [Arc::DataPoint](#).

#### 4.12.2.46 virtual bool Arc::DataPointIndex::WriteOutOfOrder () [virtual]

Returns true if URL can accept scattered data for \*writing\* operation.

Implements [Arc::DataPoint](#).

### 4.15.1 Detailed Description

Keeps track of average and instantaneous transfer speed.

Also detects data transfer inactivity and other transfer timeouts.

### 4.15.2 Constructor & Destructor Documentation

#### 4.15.2.1 Arc::DataSpeed::DataSpeed (time\_t *base* = DATASPEED\_AVERAGING\_PERIOD)

Constructor

**Parameters:**

*base* time period used to average values (default 1 minute).

#### 4.15.2.2 Arc::DataSpeed::DataSpeed (unsigned long long int *min\_speed*, time\_t *min\_speed\_time*, unsigned long long int *min\_average\_speed*, time\_t *max\_inactivity\_time*, time\_t *base* = DATASPEED\_AVERAGING\_PERIOD)

Constructor

##### Parameters:

*base* time period used to average values (default 1 minute).

*min\_speed* minimal allowed speed (Butes per second). If speed drops and holds below threshold for *min\_speed\_time*\_ seconds error is triggered.

*min\_speed\_time*

*min\_average\_speed*\_ minimal average speed (Bytes per second) to trigger error. Averaged over whole current transfer time.

*max\_inactivity\_time* - if no data is passing for specified amount of time (seconds), error is triggered.

#### 4.15.2.3 Arc::DataSpeed::~DataSpeed (void)

Destructor.

### 4.15.3 Member Function Documentation

#### 4.15.3.1 time\_t Arc::DataSpeed::get\_max\_inactivity\_time () [inline]

Get inactivity timeout.

#### 4.15.3.2 void Arc::DataSpeed::hold (bool *disable*)

Turn off speed control.

##### Parameters:

*disable* true to turn off.

#### 4.15.3.3 bool Arc::DataSpeed::max\_inactivity\_time\_failure () [inline]

Check if maximal inactivity time error was triggered.

#### 4.15.3.4 bool Arc::DataSpeed::min\_average\_speed\_failure () [inline]

Check if minimal average speed error was triggered.

#### 4.15.3.5 bool Arc::DataSpeed::min\_speed\_failure () [inline]

Check if minimal speed error was triggered.

**4.15.3.6 void Arc::DataSpeed::reset (void)**

Reset all counters and triggers.

**4.15.3.7 void Arc::DataSpeed::set\_base (time\_t *base\_* = DATASPEED\_AVERAGING\_PERIOD)**

Set averaging time period.

**Parameters:**

*base* time period used to average values (default 1 minute).

**4.15.3.8 void Arc::DataSpeed::set\_max\_data (unsigned long long int *max* = 0)**

Set amount of data to be transferred. Used in verbose messages.

**Parameters:**

*max* amount of data in bytes.

**4.15.3.9 void Arc::DataSpeed::set\_max\_inactivity\_time (time\_t *max\_inactivity\_time*)**

Set inactivity timeout.

**Parameters:**

*max\_inactivity\_time* - if no data is passing for specified amount of time (seconds), error is triggered.

**4.15.3.10 void Arc::DataSpeed::set\_min\_average\_speed (unsigned long long int *min\_average\_speed*)**

Set minimal average speed.

**Parameters:**

*min\_average\_speed* minimal average speed (Bytes per second) to trigger error. Averaged over whole current transfer time.

**4.15.3.11 void Arc::DataSpeed::set\_min\_speed (unsigned long long int *min\_speed*, time\_t *min\_speed\_time*)**

Set minimal allowed speed.

**Parameters:**

*min\_speed* minimal allowed speed (Bytes per second). If speed drops and holds below threshold for *min\_speed\_time* seconds error is triggered.

*min\_speed\_time*

**4.15.3.12 void Arc::DataSpeed::set\_progress\_indicator (show\_progress\_t func = NULL)**

Specify which external function will print verbose messages. If not specified internal one is used.

**Parameters:**

*pointer* to function which prints information.

**4.15.3.13 bool Arc::DataSpeed::transfer (unsigned long long int n = 0)**

Inform object, about amount of data has been transferred. All errors are triggered by this method. To make them work application must call this method periodically even with zero value.

**Parameters:**

*n* amount of data transferred (bytes).

**4.15.3.14 unsigned long long int Arc::DataSpeed::transferred\_size (void) [inline]**

Returns amount of data this object knows about.

**4.15.3.15 bool Arc::DataSpeed::verbose (void)**

Check if speed information is going to be printed.

**4.15.3.16 void Arc::DataSpeed::verbose (const std::string & prefix)**

Print information about current speed and amount of data.

**Parameters:**

*'prefix'* add this string at the beginning of every string.

**4.15.3.17 void Arc::DataSpeed::verbose (bool val)**

Activate printing information about current time speeds, amount of transferred data.

### 4.16.1 Detailed Description

Status code returned by many [DataPoint](#) methods.

A class to be used for return types of all major data handling methods. It describes the outcome of the method.

### 4.16.2 Member Enumeration Documentation

#### 4.16.2.1 enum [Arc::DataStatus::DataStatusType](#)

Status codes.

#### Enumerator:

- Success*** Operation completed successfully.
- ReadAcquireError*** Source is bad URL or can't be used due to some reason.
- WriteAcquireError*** Destination is bad URL or can't be used due to some reason.
- ReadResolveError*** Resolving of index service URL for source failed.
- WriteResolveError*** Resolving of index service URL for destination failed.
- ReadStartError*** Can't read from source.
- WriteStartError*** Can't write to destination.
- ReadError*** Failed while reading from source.
- WriteError*** Failed while writing to destination.
- TransferError*** Failed while transferring data (mostly timeout).

***ReadStopError*** Failed while finishing reading from source.

***WriteStopError*** Failed while finishing writing to destination.

***PreRegisterError*** First stage of registration of index service URL failed.

***PostRegisterError*** Last stage of registration of index service URL failed.

***UnregisterError*** Unregistration of index service URL failed.

***CacheError*** Error in caching procedure.

***CredentialsExpiredError*** Error due to provided credentials are expired.

***DeleteError*** Error deleting location or URL.

***NoLocationError*** No valid location available.

***LocationAlreadyExistsError*** No valid location available.

***NotSupportedForDirectDataPointsError*** Operation has no sense for this kind of URL.

***UnimplementedError*** Feature is unimplemented.

***IsReadingError*** [DataPoint](#) is already reading.

***IsWritingError*** [DataPoint](#) is already writing.

***CheckError*** Access check failed.

***ListError*** File listing failed.

***StatError*** File/dir stating failed.

***NotInitializedError*** Object initialization failed.

***SystemError*** Error in OS.

***StageError*** Staging error.

***InconsistentMetadataError*** Inconsistent metadata.

***ReadPrepareError*** Can't prepare source.

***ReadPrepareWait*** Wait for source to be prepared.

***WritePrepareError*** Can't prepare destination.

***WritePrepareWait*** Wait for destination to be prepared.

***ReadFinishError*** Can't finish source.

***WriteFinishError*** Can't finish destination.

***SuccessCached*** Data was already cached.

***UnknownError*** Undefined.

### 4.16.3 Member Function Documentation

#### 4.16.3.1 `std::string Arc::DataStatus::GetDesc () const` [inline]

Get a text description of the status.

#### 4.16.3.2 `bool Arc::DataStatus::Passed () const` [inline]

Returns true if no error occurred.

#### 4.16.3.3 `bool Arc::DataStatus::Retryable () const` [inline]

Returns true if the error was temporary and could be retried.

#### 4.16.3.4 void Arc::DataStatus::SetDesc (const std::string & *d*) [inline]

Set a text description of the status.

The documentation for this class was generated from the following file:

- DataStatus.h

## 4.17 Arc::FileCache Class Reference

[FileCache](#) provides an interface to all cache operations.

```
#include <FileCache.h>

- [operator bool](#) ()
- bool [operator==](#) (const [FileCache](#) &a)

### 4.17.1 Detailed Description

[FileCache](#) provides an interface to all cache operations.

An instance of [FileCache](#) should be created per job, and all files within the job are managed by that instance. When it is decided a file should be downloaded to the cache, [Start\(\)](#) should be called, so that the cache file can be prepared and locked. When a transfer has finished successfully, [Link\(\)](#) should be called to create a hard link to a per-job directory in the cache and then soft link, or copy the file directly to the session directory so it can be accessed from the user's job. [Stop\(\)](#) must then be called to release any locks on the cache file. After the job has finished, [Release\(\)](#) should be called to remove the hard links.

The cache directory(ies) and the optional directory to link to when the soft-links are made are set in the global configuration file. The names of cache files are formed from a hash of the URL specified as input to the job. To ease the load on the file system, the cache files are split into subdirectories based on the first two characters in the hash. For example the file with hash 76f11edda169848038efbd9fa3df5693 is stored in 76/f11edda169848038efbd9fa3df5693. A cache filename can be found by passing the URL to [Find\(\)](#). For more information on the structure of the cache, see the A-REX Administration Guide (NORDUGRID-TECH-14).

A metadata file with the '.meta' suffix is stored next to each cache file. This contains the URL corresponding to the cache file and the expiry time, if it is available.

While cache files are downloaded, they are locked using the FileLock class, which creates a lock file with the '.lock' suffix next to the cache file. Calling [Start\(\)](#) creates this lock and [Stop\(\)](#) releases it. All processes calling [Start\(\)](#) must wait until they successfully obtain the lock before downloading can begin or an existing cache file can be used. Once a process obtains a lock it must later release it by calling [Stop\(\)](#) or [StopAndDelete\(\)](#). Once a cache file is successfully linked to the per-job directory in [Link\(\)](#), it is also unlocked, but [Stop\(\)](#) should still be called after.

## 4.17.2 Constructor & Destructor Documentation

### 4.17.2.1 Arc::FileCache::FileCache (const std::string & *cache\_path*, const std::string & *id*, uid\_t *job\_uid*, gid\_t *job\_gid*)

Create a new [FileCache](#) instance.

#### Parameters:

*cache\_path* The format is "cache\_dir[ link\_path]". path is the path to the cache directory and the optional link\_path is used to create a link in case the cache directory is visible under a different name during actual usage. When linking from the session dir this path is used instead of cache\_path.

*id* the job id. This is used to create the per-job dir which the job's cache files will be hard linked from

*job\_uid* owner of job. The per-job dir will only be readable by this user

*job\_gid* owner group of job

### 4.17.2.2 Arc::FileCache::FileCache (const std::vector< std::string > & *caches*, const std::string & *id*, uid\_t *job\_uid*, gid\_t *job\_gid*)

Create a new [FileCache](#) instance with multiple cache dirs

#### Parameters:

*caches* a vector of strings describing caches. The format of each string is "cache\_dir[ link\_path]".

*id* the job id. This is used to create the per-job dir which the job's cache files will be hard linked from

*job\_uid* owner of job. The per-job dir will only be readable by this user

*job\_gid* owner group of job

### 4.17.2.3 Arc::FileCache::FileCache (const std::vector< std::string > & *caches*, const std::vector< std::string > & *remote\_caches*, const std::vector< std::string > & *draining\_caches*, const std::string & *id*, uid\_t *job\_uid*, gid\_t *job\_gid*, int *cache\_max* = 100, int *cache\_min* = 100)

Create a new [FileCache](#) instance with multiple cache dirs, remote caches and draining cache directories.

#### Parameters:

*caches* a vector of strings describing caches. The format of each string is "cache\_dir[ link\_path]".

*remote\_caches* Same format as caches. These are the paths to caches which are under the control of other Grid Managers and are read-only for this process.

*draining\_caches* Same format as caches. These are the paths to caches which are to be drained.

*id* the job id. This is used to create the per-job dir which the job's cache files will be hard linked from

*job\_uid* owner of job. The per-job dir will only be readable by this user

*job\_gid* owner group of job

*cache\_max* maximum used space by cache, as percentage of the file system

*cache\_min* minimum used space by cache, as percentage of the file system

#### 4.17.2.4 Arc::FileCache::FileCache () [inline]

Default constructor. Invalid cache.

### 4.17.3 Member Function Documentation

#### 4.17.3.1 bool Arc::FileCache::AddDN (const std::string & *url*, const std::string & *DN*, const Time & *expiry\_time*)

Add the given DN to the list of cached DNs with the given expiry time

##### Parameters:

*url* the url corresponding to the cache file to which we want to add a cached DN

*DN* the DN of the user

*expiry\_time* the expiry time of this DN in the DN cache

#### 4.17.3.2 bool Arc::FileCache::CheckCreated (const std::string & *url*)

Check if there is an information about creation time. Returns true if the file exists in the cache, since the creation time is the creation time of the cache file.

##### Parameters:

*url* the url corresponding to the cache file for which we want to know if the creation date exists

#### 4.17.3.3 bool Arc::FileCache::CheckDN (const std::string & *url*, const std::string & *DN*)

Check if the given DN is cached for authorisation.

##### Parameters:

*url* the url corresponding to the cache file for which we want to check the cached DN

*DN* the DN of the user

#### 4.17.3.4 bool Arc::FileCache::CheckValid (const std::string & *url*)

Check if there is an information about expiry time.

##### Parameters:

*url* the url corresponding to the cache file for which we want to know if the expiration time exists

**4.17.3.5 bool Arc::FileCache::Copy (const std::string & *dest\_path*, const std::string & *url*, bool *executable* = false)**

Copy the cache file corresponding to *url* to the *dest\_path*. The session directory is accessed under the uid passed in the constructor, and switching uid involves holding a global lock. Therefore care must be taken in a multi-threaded environment.

This method is deprecated - [Link\(\)](#) should be used instead with *copy* set to true.

**4.17.3.6 std::string Arc::FileCache::File (const std::string & *url*)**

Returns the full pathname of the file in the cache which corresponds to the given *url*.

**Parameters:**

*url* the URL to look for in the cache

**4.17.3.7 Time Arc::FileCache::GetCreated (const std::string & *url*)**

Get the creation time of a cached file. If the cache file does not exist, 0 is returned.

**Parameters:**

*url* the url corresponding to the cache file for which we want to know the creation date

**4.17.3.8 Time Arc::FileCache::GetValid (const std::string & *url*)**

Get expiry time of a cached file. If the time is not available, a time equivalent to 0 is returned.

**Parameters:**

*url* the url corresponding to the cache file for which we want to know the expiry time

**4.17.3.9 bool Arc::FileCache::Link (const std::string & *link\_path*, const std::string & *url*, bool *copy*, bool *executable*)**

Create a hard-link to the per-job dir from the cache dir, and then a soft-link from here to the session directory. This is effectively 'claiming' the file for the job, so even if the original cache file is deleted, eg by some external process, the hard link still exists until it is explicitly released by calling [Release\(\)](#).

If *cache\_link\_path* is set to "." then files will be copied directly to the session directory rather than via the hard link.

The session directory is accessed under the uid and gid passed in the constructor.

**Parameters:**

*link\_path* path to the session dir for soft-link or new file

*url* url of file to link to or copy

*copy* If true the file is copied rather than soft-linked to the session dir

*executable* If true then file is copied and given execute permissions in the session dir

**4.17.3.10** `Arc::FileCache::operator bool (void)` `[inline]`

Returns true if object is useable.

**4.17.3.11** `bool Arc::FileCache::operator== (const FileCache & a)`

Return true if all attributes are equal

**4.17.3.12** `bool Arc::FileCache::Release () const`

Release claims on input files for the job specified by id. For each cache directory the per-job directory with the hard-links will be deleted.

**4.17.3.13** `bool Arc::FileCache::SetValid (const std::string & url, const Time & val)`

Set expiry time.

**Parameters:**

*url* the url corresponding to the cache file for which we want to set the expiry time

*val* expiry time

**4.17.3.14** `bool Arc::FileCache::Start (const std::string & url, bool & available, bool & is_locked, bool use_remote = true)`

Prepare cache for downloading file, and lock the cached file. On success returns true. If there is another process downloading the same url, false is returned and *is\_locked* is set to true. In this case the client should wait and retry later. If the lock has expired this process will take over the lock and the method will return as if no lock was present, ie *available* and *is\_locked* are false.

**Parameters:**

*url* url that is being downloaded

*available* true on exit if the file is already in cache

*is\_locked* true on exit if the file is already locked, ie cannot be used by this process

*use\_remote* Whether to look to see if the file exists in a remote cache. Can be set to false if for example a forced download to cache is desired.

**4.17.3.15** `bool Arc::FileCache::Stop (const std::string & url)`

This method (or `stopAndDelete`) must be called after file was downloaded or download failed, to release the lock on the cache file. `Stop()` does not delete the cache file. It returns false if the lock file does not exist, or another pid was found inside the lock file (this means another process took over the lock so this process must go back to `Start()`), or if it fails to delete the lock file.

**Parameters:**

*url* the url of the file that was downloaded

#### 4.17.3.16 bool Arc::FileCache::StopAndDelete (const std::string & *url*)

Release the cache file and delete it, because for example a failed download left an incomplete copy, or it has expired. This method also deletes the meta file which contains the url corresponding to the cache file. The logic of the return value is the same as [Stop\(\)](#).

##### Parameters:

*url* the url corresponding to the cache file that has to be released and deleted

The documentation for this class was generated from the following file:

- FileCache.h

## 4.18 Arc::FileCacheHash Class Reference

[FileCacheHash](#) provides methods to make hashes from strings.

```
#include <FileCacheHash.h>
```

### Static Public Member Functions

- static std::string [getHash](#) (std::string url)
- static int [maxLength](#) ()

#### 4.18.1 Detailed Description

[FileCacheHash](#) provides methods to make hashes from strings.

Currently the SHA-1 hash from the openssl library is used.

#### 4.18.2 Member Function Documentation

##### 4.18.2.1 static std::string Arc::FileCacheHash::getHash (std::string *url*) [static]

Return a hash of the given URL, according to the current hash scheme.

##### 4.18.2.2 static int Arc::FileCacheHash::maxLength () [inline, static]

Return the maximum length of a hash string.

The documentation for this class was generated from the following file:

- FileCacheHash.h

## 4.19 Arc::FileInfo Class Reference

[FileInfo](#) stores information about files (metadata).

```
#include <FileInfo.h>
```

### 4.19.1 Detailed Description

[FileInfo](#) stores information about files (metadata).

The documentation for this class was generated from the following file:

- [FileInfo.h](#)

## 4.20 Arc::MD5Sum Class Reference

Implementation of MD5 checksum.

```
#include <CheckSum.h>
```

Inheritance diagram for Arc::MD5Sum::

### 4.20.1 Detailed Description

Implementation of MD5 checksum.

The documentation for this class was generated from the following file:

- CheckSum.h
